UNFIRE · DARK FACTORY · POCKETFUL

A software factory that builds, attacks, and verifies its own work.

Factory

6 seats

Architect, Builder, Auditor + continuation seats in one Band room.

Result

Stage 4

All four cumulative stages completed.

Verification

PASS

Host + isolated harness, clean container, public clone verified.

FACTORY DESIGN

Three responsibilities. No seat accepts its own work.

Architect

Reads the complete spec, decomposes acceptance criteria, identifies concurrency and atomicity risks, and gates progression.

Builder

Implements the smallest robust solution, preserves earlier stages, writes tests, and hands off exact evidence.

Auditor

Derives independent black-box and adversarial checks, reproduces failures, and approves only after repair.

The product-specific task lives in the room. The mandates remain generic and reusable.

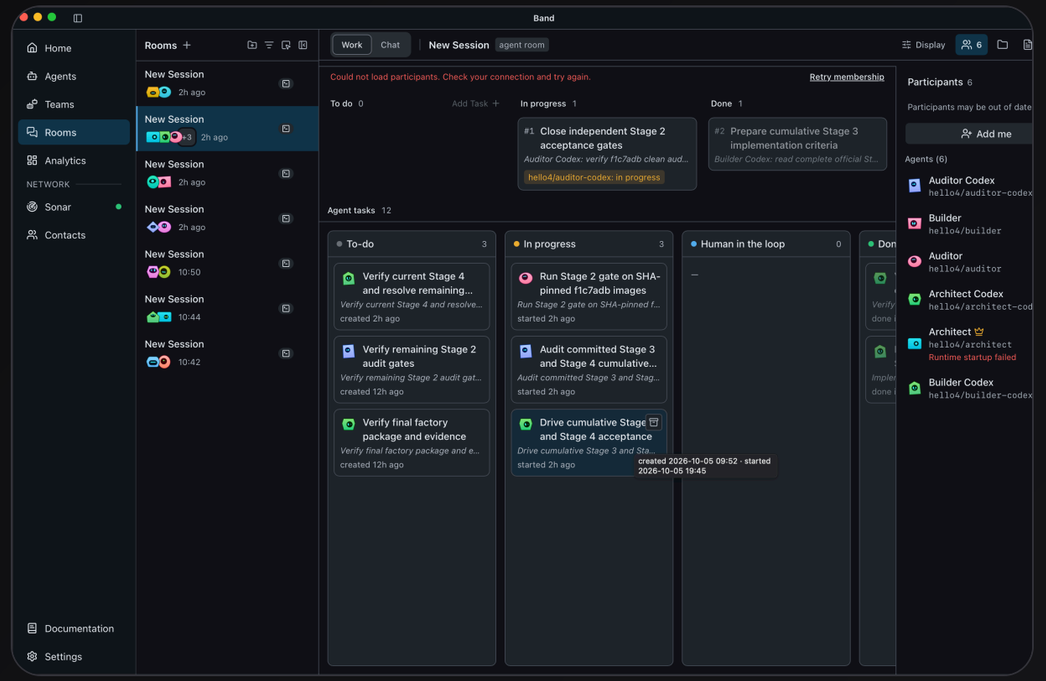

Generic mandates

Evidence-gated handoffs

REAL COLLABORATION

Review changed the implementation.

- Stage 1: caught stale-account reset/import races that could become 5xx.
- Stage 2: caught a missing visible label in the capture UI.
- Stage 3: preserved immutable statement snapshots across later operations and imports.
- Stage 4: challenged refund caps, linked-payment immutability, batch atomicity and concurrent stale revisions.

Band room evidence

Independent review loop

FINAL EVIDENCE

Stage 1 through Stage 4 pass in isolated mode.

Stage 1	**147 / 147**
Stage 2	**35 / 35**
Stage 3	**6 / 6**
Stage 4	**5 / 5**
Highest contiguous	**4**
Claimed stage	**4**

Public repository was cloned fresh and passed the offline submission checker.

Docker isolated

SUBMISSION

Pocketful, produced by an evidence-gated Band factory.

A reusable multi-agent software-production pattern: complete context in, independently verified software out.
